Miljøoplysninger	
Content	Chemical pulp Ployester Chemicals
Material	Chemical pulp Chemical pulp is produced either from softwood or hardwood. The wood chips are boiled together with chemicals and the major part of the lignin is removed. Chemical pulp is bleached in order to achieve a clean, bright and strong product, but also to increase the hygienic and absorbent qualities. There are two major bleaching methods: ECF (elementary chlorine free) and TCF (totally chlorine free). ECF is based on oxygene, chlorine dioxide and hydrogen peroxide. TCF is based on hydrogen peroxide and ozone. Polyester Polyester fibre is produced from terephtalic acid and ethyleneglycol, which react through condensation to polyester resin. The molten resin is spun to fibres through spinnerettes and cooled with air. Fibres are then cut to intended fibrelength. Chemicals Both functional and process chemicals are used. The functional chemical used is wetstrength agent. The wetstrength agent is a Polyaminopolyamide-epichlorohydrin with a very high affinity to the fibre. Process chemical used is a surfactant.
Production	This product is produced at Suameer mill, The Netherlands, and certified according to ISO 9001:2000, ISO 14001 and EMAS. Food Contact This product fulfils the legislative requirements for Food Contact materials, confirmed by external certification performed by ISEGA. The product is safe for wiping food contact surfaces and may also come occasionally into contact with foodstuffs for a short period of time
Disposing / destruction of used product	This product is mainly used for industrial processes and might through use be contaminated with different substances. This will determine how the used product will be handled / disposed of / destructed. The product itself is suitable for incineration. Contact local authorities before destruction.
